

M-Cabin walls

Exterior wall
created on 6.10.2020

Thermal protection

$U = 0,35 \text{ W}/(\text{m}^2\text{K})$

EnEV Bestand*: $U < 0,24 \text{ W}/(\text{m}^2\text{K})$

Moisture proofing

No condensate

Heat protection

Temperature amplitude damping: 3,0
phase shift: 5,7 h
Thermal capacity inside: 15,5 kJ/m²K

- ① Pine (13 mm)
- ② SIGA Majrex
- ③ Knauf Expert (100 mm)
- ④ Chip board / particle board (12 mm)
- ⑤ Tyvek® Soft
- ⑥ Rear ventilated level
- ⑦ curtain wall

Impact of each layer and comparison to reference values

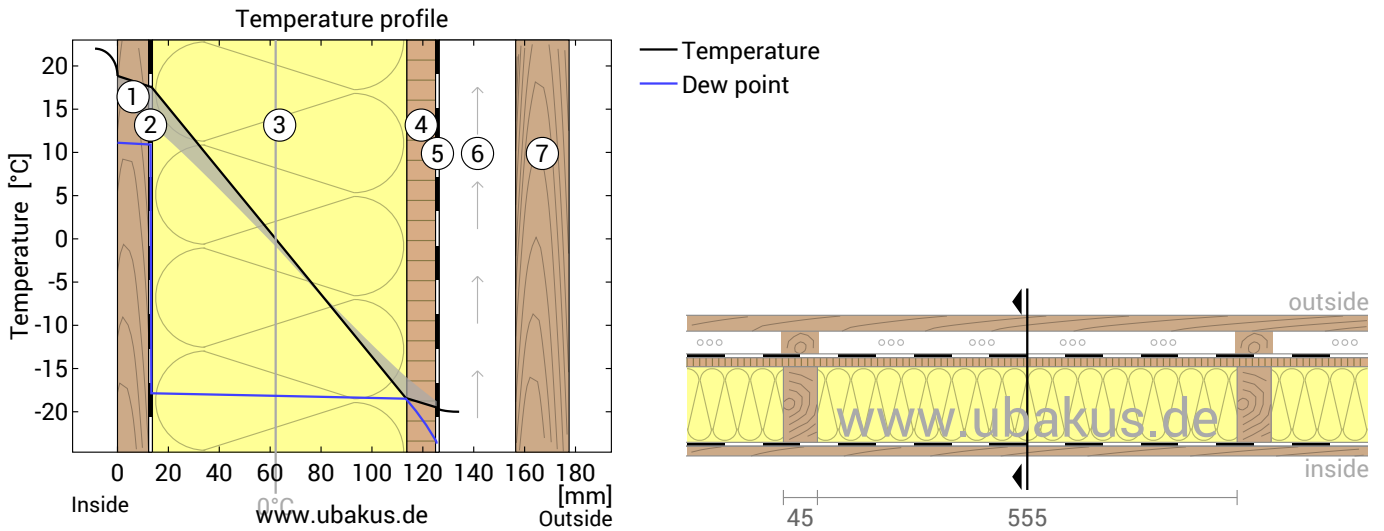

For the following figure, the thermal resistances of the individual layers were converted in millimeters insulation. The scale refers to an insulation of thermal conductivity 0,035 W/mK.

Inside air :	22,0°C / 50%		Thickness:	17,6 cm
Outside air:	-20,0°C / 70%	sd-value: 17,0 m	Weight:	32 kg/m²
Surface temperature.:	15,9°C / -19,4°C		Heat capacity:	35 kJ/m²K

M-Cabin walls, $U=0,35 \text{ W}/(\text{m}^2\text{K})$

Temperature profile

Left: Temperature and dew-point temperature at the place marked in the right figure. The dew-point indicates the temperature, at which water vapour condensates. As long as the temperature of the component is everywhere above the dew point, no condensation occurs. If the curves have contact, condensation occurs at the corresponding position.

Right: The component, drawn to scale.

Layers (from inside to outside)

#	Material	λ [W/mK]	R [m ² K/W]	Temperatur [°C]		Weight [kg/m ²]
				min	max	
	Thermal contact resistance*		0,130	15,9	22,0	
1	1,3 cm Pine	0,130	0,100	13,2	18,8	6,8
2	0,03 cm SIGA Majrex	2,300	0,000	13,2	17,6	0,2
3	10 cm Knauf Expert	0,035	2,857	-18,4	17,6	4,6
	10 cm Spruce (7,5%)	0,130	0,769	-16,1	14,2	3,4
4	1,2 cm Chip board / particle board	0,140	0,086	-19,5	-15,9	7,8
5	0,015 cm Tyvek® Soft	0,230	0,001	-19,5	-18,8	0,1
	Thermal contact resistance*		0,130	-20,0	-18,8	
6	Rear ventilated level (outside air)			-20,0	-20,0	0,0
7	curtain wall			-20,0	-20,0	9,5
17,645 cm Whole component			2,886			32,2

*Thermal contact resistances according to DIN 6946 for the U-value calculation. $R_{si}=0,25$ and $R_{se}=0,04$ according to DIN 4108-3 were used for moisture proofing and temperature profile.

Surface temperature inside (min / average / max): 15,9°C 18,4°C 18,8°C
 Surface temperature outside (min / average / max): -19,5°C -19,4°C -18,8°C

M-Cabin walls, $U=0,35 \text{ W}/(\text{m}^2\text{K})$

Moisture proofing

For the calculation of the amount of condensation water, the component was exposed to the following constant climate for 90 days: inside: 22°C und 50% Humidity; outside: -20°C und 70% Humidity (Climate according to user input).

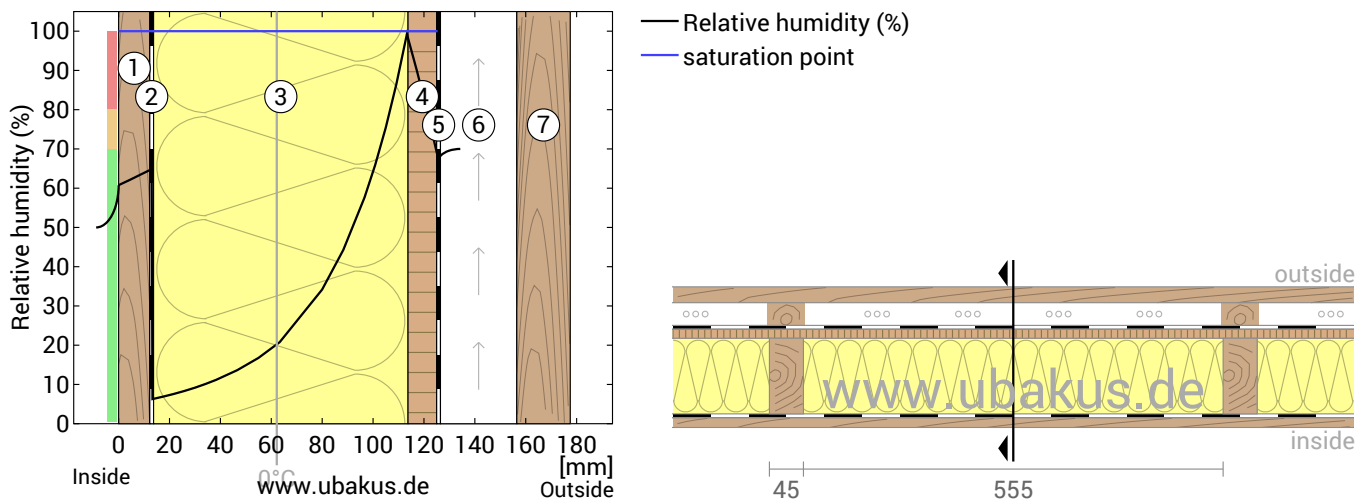

This component is free of condensate under the given climate conditions.

#	Material	sd-value [m]	Condensate [kg/m ²] [Gew.-%]	Weight [kg/m ²]
1	1,3 cm Pine	0,26	-	6,8
2	0,03 cm SIGA Majrex	15,87	-	0,2
3	10 cm Knauf Expert 10 cm Spruce (7,5%)	0,10 2,00	0,0010	4,6
4	1,2 cm Chip board / particle board	0,60	-	7,8
5	0,015 cm Tyvek® Soft	0,03	-	0,1
17,645 cm Whole component		17,00		32,2

Humidity

The temperature of the inside surface is 15,9 °C leading to a relative humidity on the surface of 73%. Some kinds of mould start to grow at relative air humidities of 70% or more, mould cannot be excluded!. To avoid mould formation, the surface temperature should be increased by (additional) insulation.

The following figure shows the relative humidity inside the component.

- ① Pine (13 mm)
- ② SIGA Majrex
- ③ Knauf Expert (100 mm)
- ④ Chip board / particle board (12 mm)
- ⑤ Tyvek® Soft
- ⑥ Rear ventilated level
- ⑦ curtain wall

Notes: Calculation using the Ubakus 2D-FE method. Convection and the capillarity of the building materials were not considered. The drying time may take longer under unfavorable conditions (shading, damp / cool summers) than calculated here.

M-Cabin walls, $U=0,35 \text{ W}/(\text{m}^2\text{K})$

Heat protection

The following results are properties of the tested component alone and do not make any statement about the heat protection of the entire room:

Top: Temperature profile within the component at different times. From top to bottom, brown lines: at 3 pm, 11 am and 7 am and red lines at 7 pm, 11 pm and 3 am.

Bottom: Temperature on the outer (red) and inner (blue) surface in the course of a day. The arrows indicate the location of the temperature maximum values. The maximum of the inner surface temperature should preferably occur during the second half of the night.

Phase shift*	5,7 h	Heat storage capacity (whole component):	35 kJ/m ² K
Amplitude attenuation **	3,0	Thermal capacity of inner layers:	15.5 kJ/m ² K
TAV ***	0,333		

* The phase shift is the time in hours after which the temperature peak of the afternoon reaches the component interior.

** The amplitude attenuation describes the attenuation of the temperature wave when passing through the component. A value of 10 means that the temperature on the outside varies 10x stronger than on the inside, e.g. outside 15-35 °C, inside 24-26 °C.

*** The temperature amplitude ratio TAV is the reciprocal of the attenuation: $TAV = 1 / \text{amplitude attenuation}$

Note: The heat protection of a room is influenced by several factors, but essentially by the direct solar radiation through windows and the total amount of heat storage capacity (including floor, interior walls and furniture). A single component usually has only a very small influence on the heat protection of the room.

The calculations presented above have been created for a 1-dimensional cross-section of the component.
